# OS Layer — Windows Update Service Disabled

## Action Performed

1. Opened the **Services** management console ( `services.msc` ) and located **Windows Update** ( `wuauserv` ).
2. Opened the service properties, changed the **Startup type** to **Disabled**, and manually clicked **Stop** to terminate the active background process.

## Verification & Findings

| | |
|---|---|
| **Symptom** | Background patch orchestration, driver signature validation, and component store updates were halted. |
| **Diagnostic Check** | Inspected the **System** log in Event Viewer for **Service Control Manager Event IDs 7000 and 7009**, confirming that dependent background tasks failed to start or receive a timely response from the disabled service. |
