Storage Layer — Low Disk Space

Action Performed

1. Checked available capacity on the system volume (`C:`) via **File Explorer**.
2. Consumed remaining disk allocation blocks by generating large placeholder/dummy files until free space dropped below the system threshold.

Troubleshooting & Remediation

Issue Encountered

Event ID 2013 did not immediately appear in Event Viewer after filling the disk, because the **Server** service (`LanmanServer`) polls storage capacity periodically rather than continuously.

Resolution

1. Opened the **Services** console (`services.msc`) and restarted the **Server** service to force an immediate storage volume evaluation.
2. Verified the low-disk trigger threshold in the Windows Registry (`regedit`) under:

   ```
   HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\LanmanServer\Parameters
   ```

   via the `DiskSpaceThreshold` DWORD value (e.g., set to `10` for a 10% free-space threshold).
